dirk van dalen s popular textbook logic and structure now in its fifth edition provides a comprehensive introduction to the basics of classical and intuitionistic logic model theory and gödel s famous incompleteness theorem propositional and predicate logic are presented in an easy to read style using gentzen s natural deduction the book proceeds with some basic concepts and facts of model theory a discussion on compactness skolem löwenheim non standard models and quantifier elimination the discussion of classical logic is concluded with a concise exposition of second order logic in view of the growing recognition of constructive methods and principles intuitionistic logic and kripke semantics is carefully explored a number of specific constructive features such as apartness and equality the gödel translation the disjunction and existence property are also included the last chapter on gödel s first incompleteness theorem is self contained and provides a systematic exposition of the necessary recursion theory this new edition has been properly revised and contains a new section on ultra products

discrete structure logic and computability introduces the beginning computer science student to some of the fundamental ideas and techniques used by computer scientists today focusing on discrete structures logic and computability the emphasis is on the computational aspects so that the reader can see how the concepts are actually used because of logic's fundamental importance to computer science the topic is examined extensively in three phases that cover informal logic the technique of inductive proof and formal logic and its applications to computer science

by analyzing seven concrete models the author examines each in regard to its logical structure list of cases derivational system and use of covert case roles

this book is focused on an emerging area i.e. combination of iot and semantic technologies which should enable breaking the silos of local and/or domain specific iot deployments taking into account the way that iot ecosystems are realized several challenges can be identified among them of definite importance are this list is obviously not exhaustive i how to provide common representation and/or shared understanding of data that will enable analysis across systematically growing ecosystems ii how to build ecosystems based on data flows iii how to track data provenance iv how to ensure manage trust v how to search for things data within ecosystems vi how to store data and assure its quality semantic technologies are often considered among the possible ways of addressing these and other related questions more precisely in academic research and in industrial practice semantic technologies materialize in the following contexts this list is also not exhaustive but indicates the breadth of scope of semantic technology usability i representation of artefacts in iot ecosystems and iot networks ii providing interoperability between heterogeneous iot artefacts iii representation of provenance information enabling provenance tracking trust establishment and quality assessment iv semantic search enabling flexible access to data originating in different places across the ecosystem v flexible storage of heterogeneous data finally semantic of things and linked open data are architectural paradigms with which the aforementioned solutions are to be integrated to provide production ready deployments

the book consists of xi parts and 28 chapters covering all areas of mathematics it is a tool for students scientists engineers students of many disciplines teachers professionals writers and also for a general reader with an interest in mathematics and in science it provides a wide range of mathematical concepts definitions propositions theorems proofs examples and numerous illustrations the difficulty level can vary depending on chapters and sustained attention will be required for some the structure and list of parts are quite classical i foundations of mathematics ii algebra iii number theory iv geometry v analytic geometry vi topology vii algebraic topology viii analysis ix category theory x probability and statistics xi applied mathematics appendices provide useful lists of symbols and tables for ready reference the publisher's hope is that this book slightly

both algorithms and the software and hardware of automatic computers have gone through a rapid development in the past 35 years the dominant factor in this development was the advance in computer technology computer parameters were systematically improved through electron tubes transistors and integrated circuits of ever increasing integration density which also influenced the development of new algorithms and programming methods some years ago the situation in computers development was that no additional enhancement of their performance could be achieved by increasing the speed of their logical elements due to the physical barrier of the maximum transfer speed of electric signals another enhancement of computer performance has been achieved by parallelism which makes it possible by a suitable organization of n processors to obtain a performance increase of up to n times research into parallel computations has been carried out for several years in many countries and many results of fundamental importance have been obtained many parallel computers have been designed and their algorithmic and programming systems built such computers include illiac iv dap staran omen star 100 texas instruments asc cray 1 c mmp cm clip 3 pepe this trend is supported by the fact that many algorithms and programs are highly parallel in their structure b the new lsi and vlsi technologies have allowed processors to be combined into large parallel structures c greater and greater demands for speed and reliability of computers are made

for a one semester freshman or sophomore level course on the fundamentals of proof writing or transition to advanced mathematics course rather than teach mathematics and the structure of proofs simultaneously this text first introduces logic as the foundation of proofs and then demonstrates how logic applies to mathematical topics this method ensures that the students gain a firm understanding of how logic interacts with mathematics and empowers them to solve more complex problems in future math courses

this edited volume discusses the development theory advanced by the economic commission for latin america and the caribbean eclac in the 1940s and its transformations through the second half of the twentieth century in this time frame the authors identify two approaches structuralism 1950 1980 and neo structuralism 1980 onwards the contributors describe the transition in terms of economic theory and policy the conceptualization of the state and the consideration of space on regional and global scales they argue that structuralism is still relevant for understanding the current problems of development if a careful and appropriate recovery and update of its main ideas and concepts is made in relation to the current context of globalization and

this monograph gives a logical treatment of two central aspects of the concept of information namely information processing and information structure the structure of information is treated as a topic in model theory while information processing is seen as an aspect of proof theory a wide spectrum of substructural subsystems of intuitionistic propositional logic and of nelson s constructive logic with strong negation is investigated in particular the problems of cut elimination functional completeness and coding of proofs with lambda terms are handled finally an interpretation of these systems in terms of states of information and operations over these states is presented
